

## INTELLICON® - a microprocessor for your furnace that lowers fuel use and save you \$\$\$.

As promised, we are re-offering the Intellicon furnace micro-computer wholesale to our membership. In recent years members ordered 1000+ units and saved between 10% to 20% on their fuel consumption.

The Intellicon FA and HW+ are microcomputer controlled devices that save approximately 14% of propane or oil usage in the winter and approximately 28% of your fuel in the summer. It is money-backed, guarantee by the manufacturer, to save at least a minimum of 10%. Once installed on your fuel burner, it takes 72 hours to take in the operating information of your system. Once armed with that knowledge, it takes control of the burner. At today's prices for oil, average payback for the device twelve months. The HW+ is a sixth generation, programmable unit for hot water systems and may be used on most systems. The Intellicon FA for forced air systems is also sixth generation with similar technology as you can see in the brochure below.

Illuminated LCD display shows fuel consumption savings, operating modes, system diagnostics and operating temperatures.

- Patented process reduces fuel consumption—typically 10% to 20%
- Increased savings without replacing or upgrading costly system components
- “State-of-the-art” microcomputer controller
- Simple installation by qualified installer
- Maximum efficiency year-round
- Reduces maintenance and extends boiler life
- Fail-safe operation
- Guaranteed by Intellidyne to reduce fuel consumption

15-year replacement warranty for breakdowns or defects
